Human Agent Loop / Plan the club lunch

About 18 minutes of teaching and demo, followed by 20 minutes of student work. This follows the Microsoft guest session on prompting.

Five-minute prep

Open a fresh chatbot conversation and note the model. Keep the lecture, this guide and the prepared demo in separate tabs.

Have the student page or two-page handout ready. Students choose their own wording; the sample messages in this guide are for your demo.

Read the four turns once. A sample route costs \$180, then \$200, then \$188 with pickup. Several other menus are valid.

Run of show

- 0-3** Introduce yourself and get a chatbot open.
- 3-5** App, model, tools and the two comparison charts.
- 5-8** Four Reddit moments; ask the room to spot the gap.
- 8-12** Run the four-turn lunch demo, about one minute per part.
- 12-18** Debrief, name the loop, explain the lab and close.
- 18-38** Student work: four parts, about five minutes each.

If the live demo gets weird

A mistake is useful material: pause and check it with the room. If login or generation stalls, open [lab1/demo.html](#) and show the prepared response for that part. After two minutes of login trouble, pair students up.

One conversation, four turns

1. Make a first plan

TYPE OR SAY

I'm planning a fictional student club lunch tomorrow at noon for 24 people. Each needs one meal and one drink. Chicken sandwiches are \$6, vegetarian wraps \$5, drinks \$1, and delivery is \$12 for the entire order. All prices include taxes and fees; my total budget is \$200. Help me propose an order and identify what I should check before committing. We are only planning.

SAY TO THE ROOM

We have enough information to make a provisional plan. We do not yet know everyone's dietary needs, the stock, or whether delivery will arrive on time.

LOOK FOR

One possible starting plan is 24 chicken sandwiches, 24 drinks and delivery: $24 \times \$6 + 24 \times \$1 + \$12 = \180 . It fits the budget but still needs dietary, stock and timing checks. A mix of meals is equally valid.

If needed: Which parts of that plan are confirmed, and which are assumptions? Show me the arithmetic.

2. The guest list changes

TYPE OR SAY

Update: there are now 30 people, including 8 vegetarians. The supplier has only 18 chicken sandwiches, but enough wraps and drinks. The \$200 total budget and one meal plus one drink per person still apply. How should we revise the plan?

SAY TO THE ROOM

Eight vegetarians means at least eight wraps. It does not mean everyone else needs chicken. The stock limit and the budget are different constraints.

LOOK FOR

With delivery, 8 chicken sandwiches + 22 wraps + 30 drinks + \$12 delivery = $\$48 + \$110 + \$30 + \$12 = \$200$. All 30 wraps also work at \$192. At most 8 chicken sandwiches fit the budget while delivery is included.

If needed: Check the total including delivery. Does every person get a meal and a drink, with at least eight vegetarian meals?

One conversation, four turns

3. Delivery falls through

TYPE OR SAY

The earliest delivery is 12:30 p.m., but lunch starts at noon. We can pick up at 11:15 a.m. with no delivery fee. A club member might collect it, but has not confirmed. What can we plan now, and what must wait?

SAY TO THE ROOM

A cheaper order is useful, but it does not get the food to the event. “Might collect” is not a confirmed pickup.

LOOK FOR

Pickup could solve the timing problem, but the collector and arrival before noon are still unconfirmed. Keeping 8 chicken, 22 wraps and 30 drinks costs \$188 with pickup. Changing to 18 chicken, 12 wraps and 30 drinks costs \$198. Either is a provisional option; there is no need to spend all \$200.

If needed: What evidence do we need before we call pickup a confirmed plan? What should we do if the member cannot collect it?

4. Close the loop

TYPE OR SAY

The club member confirms pickup at 11:15 a.m. and arrival at the lunch before noon. Give me a short final proposal with quantities, total cost and collection details. Explain why our planning task is complete. No order has been placed.

SAY TO THE ROOM

We can stop because the proposal meets the constraints and the pickup is confirmed. Finishing a plan is different from placing an order.

LOOK FOR

Example final proposal: 8 chicken sandwiches, 22 vegetarian wraps and 30 drinks, total \$188. The confirmed club member collects at 11:15 a.m. and brings the order before noon. This serves 30 people, covers 8 vegetarians, uses no more than 18 chicken sandwiches and stays within \$200. Planning is complete; ordering is a separate action.

If needed: Point to the evidence for the quantity, dietary requirement, stock, budget and arrival time.

More than one menu works

Let C be the number of chicken sandwiches. The remaining meals are vegetarian wraps. Every guest also receives a \$1 drink.

24 guests, with delivery / \$156 + C

0-24 chicken sandwiches fit the initial budget. Dietary needs, stock and timing still need checking.

30 guests, with delivery / \$192 + C

0-8 chicken sandwiches fit. At least 22 meals must be wraps to stay within \$200.

30 guests, with pickup / \$180 + C

0-18 chicken sandwiches fit. Stock is now the tighter limit. Pickup still needs confirmation in Part 3.

Valid final examples: 8 chicken + 22 wraps + 30 drinks = \$188; 18 chicken + 12 wraps + 30 drinks = \$198; 30 wraps + 30 drinks = \$180. Pickup removes the delivery fee. Students may keep an earlier menu.

Before calling the plan finished

30 meals and 30 drinks; at least 8 wraps; no more than 18 chicken sandwiches.

Total of \$200 or less, including any fees.

Confirmed 11:15 a.m. pickup and arrival before noon.

A checked proposal with no claim that anyone placed an order.

While they work, then debrief

At each five-minute mark, invite students to the next part. Ask which facts carried forward and what is still an assumption. If time allows, hear one useful response and one human check from the room. Accept different menus that meet the constraints. A caught and explained model error is useful evidence.

A person supplies the facts in this exercise. A connected agent would need tools and permissions to act. Students submit four short records and the model name; no prescribed prompt, loop diagram or full transcript is required.
